CFO

WELCOME!

PRECISE TECHNOLOGY AT YOUR SIDE

Dear patient,

For many patients and their relatives, a tumour diagnosis gives rise to a state of considerable strain coupled with insecurity and anxiety. But today there are a number of encouraging methods to treat patients with such a diagnose.

One of these is the innovative Cyberknife System, a leading-edge technology that provides an alternative or supplement to conventional surgery. Precise radiosurgical treatment can be effectively applied to eliminate a tumour in the brain, spine, eye or other parts of the body (e.g. liver, lungs, kidney or prostate).

With Cyberknife the surrounding healthy tissue can be maximally protected. Treatment generally takes 30 minutes. In most cases only one treatment session is required. The procedure is pain-free and on an outpatient basis. As opposed to conventional surgery, it does not require an anaesthesia and you can continue your everyday routine soon after treatment.

We will be happy to tell you more about Cyberknife treatment personally. We will answer your questions about the course of treatment and give you details of the chances and risks involved. It is our responsibility to provide you, as a patient, with the best possible advice. The Cyberknife Center Munich has the latest generation of Cyberknife technology (Cyberknife M6) including Multileaf Collimator (MLC) and is one of the world's leading centers for radiosurgery.

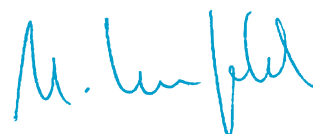

If you would like to know more about Cyberknife treatment you can either contact us directly or through your treating physician.

Prof. Dr. med. Alexander Muacevic
Radiosurgeon - Neurosurgeon

Dr. med. Alfred Haidenberger
Radiation Oncologist

Radiation delivery device

Imaging

Treatment planning

THE TECHNOLOGY – WHAT IS CYBERKNIFE?

The Cyberknife is used for radiosurgical treatment of tumours in all parts of the body. Its technology is based on the optimal interaction between a digital imaging system and a robot-guided radiation device. The exceptional success of the treatment is due to the ideal synchronisation of its individual components.

Robotic system

The robot used for Cyberknife is better known for its use in the automotive industry. The high level of technical precision required there is equally suitable for its use in medical applications. The robotic arm allows maximum flexibility and enables 3,000 different radiation beam projections, which facilitates tissue conservation to an extent not achieved by any other form of treatment.

Radiation delivery device

The radiation delivery device comprises a linear accelerator (LINAC) attached to a robotic arm. The high-energy LINAC destroys tumour cells at a genetic level. Cells then become unable to divide and the tumour dies. The Cyberknife technology effectively guides the radiation beam in such a way that a lethal radiation level is only directed to the tumor. Surrounding healthy tissue is maximum protection.

Imaging

The robotic system is linked to a computer-guided localisation system, which supplies high-resolution digital images to ensure accurate targeting. During treatment, digitally reconstructed radiographs (DDR) are taken from the computed tomography planning scans and continuously compared in real-time with the respective images supplied by the imaging system. This even allows the precise treatment of tumours that normally move during normal respiration. This feature is unique to Cyberknife and allows radiation single-session treatment to other parts of the body, instead of over several weeks. A breath-holding technique or anaesthesia with induced respiratory arrest, as required with other systems, is no longer necessary.

„The system’s high degree of accuracy means the side-effect profile is extremely favourable.“

Dr. med. Markus Kufeld

BRAIN

- Acoustic neuroma
- Meningioma
- AVM
- Brain metastases
- Trigeminal neuralgia
- Uveal melanoma

LUNG

- Lung cancer (stage I/II)
- Lung metastases

SPINE

- Spinal metastases
- Spinal neurinoma
- Spinal meningioma

LIVER

- Primary liver carcinoma
- Liver metastases

KIDNEY

- Renal cell carcinoma
- Urothelial carcinoma

PROSTATE

- Prostate cancer

INDICATIONS

WHAT CAN BE TREATED?

Which tumours can be treated with the Cyberknife? The indication criteria for radiosurgery are relatively strict – e.g. tumours should:

- not be too big (depending on the organ system) and
- be clearly definable.

If all the criteria are met, the Cyberknife can be used in many different parts of the body. We are continually extending our treatment range in line with scientific developments in the field of medicine.

It is therefore important that we discuss your individual situation with you personally.

„Specialized medical physicists check the Cyberknife for technical accuracy and safety every day.“

Dr. techn. Christoph Fürweger

Planning

Treatment

Treatment

Check-ups

STAGES OF TREATMENT

TREATMENT INVOLVES THE FOLLOWING STAGES

Planning

A team of specialist physicians and medical physicists evaluate the results of imaging and transfer the CT and MRT images to the Cyberknife treatment plan. After determining the exact nature of the tumour and surrounding structures, the radiation dosage and beam direction for treatment are planned. Depending on the size and location of the lesion this can take up to 24 hours.

Treatment

Treatment begins with your normal breakfast. Any medication can also be taken as normal. You will then meet our medical team and take up a comfortable position to prepare for treatment (with your favourite music in the background, if you wish). You maintain contact with the medical team during the entire treatment process by means of a number of cameras and a microphone. Cyberknife treatment is generally only carried out once, but can be repeated on further treatable tumours during the process. It lasts, on average, 30 minutes, depending on the diagnosis. Treatment can be interrupted at any time, e.g. to drink something, or go to the bathroom. Treatment then continues as before. There is a final meeting at the end of treatment to discuss further medication and the required check-up intervals. You are then free to go about your normal daily activities. You are not required to remain in hospital after treatment.

Check-ups

The medical follow-up is done through regular medical check-ups and imaging. A first check-up is scheduled 3 to 6 months after treatment, depending on the diagnosis. This normally involves a new CT or MRT scan. This can be done in your home country and the results can be transferred to us.

We offer an individual and friendly patient service. In addition patients needs are always our focus."

Nadja Malenoff
Office Director

TESTIMONIALS

“My brain is my personality! That was why I wanted safe and effective treatment with no post-operative side-effects for my meningioma. On leaving the Cyberknife Center after treatment, I was even able to go on a sight-seeing tour of Munich.”

Natasha H. McD., Ljubljana (Slovenia)

„Cyberknife treatment for my prostate cancer changed the quality of my life. At the time, my greatest concerns and fears were that cancer treatment would mean having to deal with serious and onerous complications as a result. But I was able to continue with my normal daily routine immediately after Cyberknife treatment. Today – several years after treatment – my PSA values are below 1 ng/ml and I am in good physical shape.”

Ronald H., Kressbronn (Germany)

„I experienced no adverse effects from outpatient treatment for a brain angioma and travelled home by tube immediately afterwards. I had no side effects whatsoever and found it amazing that I notice no symptoms at all, neither at the time, nor up to the present day – more than eight years after treatment. No one needs to be anxious about Cyberknife treatment.”

Ute H., Munich (Germany)

TESTIMONIALS

„Cyberknife treatment for an acoustic neuroma allowed me to continue with my mountain biking hobby shortly afterwards. Treatment was entirely pain-free and I was able to travel home to Austria immediately afterwards. I'm really glad to have been able to avoid major brain surgery and a long physical recovery period. That was several years ago, and I'm still going strong.“

Johannes W., Götzis (Austria)

„All the other doctors I saw refused to treat my large brain angioma. Doctors at the Cyberknife Center were able to help me. My symptoms, such as lack of concentration, headaches and leg spasms, improved within the first three months of treatment. I'm really glad I had Cyberknife treatment.“

Iden J., Munich (Germany)

CYBERKNIFE

TEAM

In 2005 Prof. Muacevic und Prof. Wowra, in cooperation with the University Hospital of Munich, founded the first Cyberknife Center in Munich, Germany. Currently the center is run clinically by Prof. Muacevic, Dr. Haidenberger and Dr. Kufeld. Our physicians, often in cooperation with specialist colleges in the clinic's respective medical departments, embody the best there is in personalised patient care.

Prof. Dr. med. Alexander Muacevic

Radiosurgeon – Neurosurgeon

Education and professional background

| | |
|-------------|--|
| 1989 – 1995 | Studied medicine at Johannes Gutenberg University Mainz, Germany |
| 1990 | Grant from Boehringer Ingelheim KG pharmacology dept. in Ridgefield, Connecticut, USA (Dr. Wegner) |
| 1991 – 1995 | Stay in Los Angeles (USC), Charlottesville Virginia and London (Institute of Neurology and Neurosurgery) |
| 1995 | Doctoral studies under Prof. Dr. A. Perneczky, Mainz |
| 1996 – 2003 | Houseman, junior doctor and then specialist registrar for neurosurgery, Clinic for Neurosurgery, Grosshadern Clinic, Ludwig-Maximilian University Munich |
| 2005 | Completed further radiosurgery training |
| 2006 | Habilitation at the Ludwig-Maximilian University, Munich |
| 2011 – 2013 | President of The Radiosurgery Society |
| 2013 | Appointed professor at the Ludwig-Maximilian University, Munich |

Awards

| | |
|------|---|
| 2003 | Aesculap prize of the European Association of Neurosurgical Societies |
|------|---|

Professional societies

| | |
|-------------|--|
| Since 2007 | Supervisory Board Member of The Radiosurgery Society (RSS) |
| 2011 – 2013 | President of The Radiosurgery Society |
| 2014 – 2015 | Chairman of Board of Directors, The Radiosurgery Society |

Official memberships

ASTRO (American Society of Radiation Oncology), ISRS (International Stereotactic Radiosurgery Society), EANS (European Association for Neurosurgery), DEGRO (German Society for Radiation Oncology), Stereotaxis committee

Scientific engagement

More than 100 publications, numerous lectures at national and international scientific congresses and conferences. Founder of cureus.com, an innovative scientific publication platform 2012 together with Dr. John R. Adler, Stanford School of Medicine, USA

Dr. med. Alfred Haidenberger

Radiation Oncologist

Hospital Appointments and other Professional Positions

| | |
|-------------|---|
| 1991 – 1999 | Medicine at the Leopold-Franzens University, Innsbruck, Austria, Graduation as “Doktor der gesamten Heilkunde“(MD) |
| 1999 – 2005 | Resident at the Dept. of Radiooncology, University Hospital, Innsbruck, Austria |
| 2005 | Board Exams and Certification, Austria (European Union) |
| 2005 – 2007 | Specialist in Radiooncology, Medical University Innsbruck |
| 2007 – 2008 | Specialist in Radiooncology, Hospital Wiener Neustadt, Austria |
| 2008 – 2010 | Specialist on Radiooncology, Hospital Vöcklabruck, Austria |
| 2010 – 2013 | Chief Physician and Head of Department Proton Therapy Certification Germany, Rinecker Proton Therapy Center Munich, Germany |
| 2014 – 2015 | Specialist on Radiooncology, Department Prof. Wilkowski, Agatharied, Germany |
| 2015 | Dr. med. Alfred Haidenberger joined the medical team at the Cyberknife Center in Munich-Großhadern October 2015 |

Committee Appointments

| | |
|-------------|--|
| 2001 – 2010 | Member of the Board of Directors, “Österreichische Gesellschaft für Radioonkologie, Radiobiologie und Medizinische Radiophysik“ (ÖGRO) |
| 2007 – 2010 | Member of the Board of Directors, “Tiroler Arbeitskreis Experimentelle Onkologie“ (TEXO) |
| 2010 – 2014 | President and Member of the Board of Directors, “Zukunftsorientierte Radioonkologie“ (ZORO) |

Awards and Honors

| | |
|------|--|
| 2002 | ÖGRO Prize 2002 |
| 2003 | ÖGRO Prize 2003 |
| 2004 | Research support grant from the “Österreichische Krebshilfe Tirol“ |
| 2006 | Research support grant from the “Österreichische Krebshilfe Tirol“ |
| 2009 | Research support grant from “Roche“ (Neurooncology) |
| 2010 | Research support grant from “Roche“ (NSCLC) |

Dr. med. Markus Kufeld

Radiosurgeon - Neurosurgen

Clinical Career

- 1998 - 2000 Intern Department of Neurosurgery University of Erlangen
- 2000 - 2005 Junior Resident and Scientific Fellow, Department of Neurosurgery, Charité – Universitätsmedizin Berlin, Campus Virchow-Klinikum
- 2007 – 2010 Neurosurgeon at the European Cyberknife Center Munich
- 2011 - 2017 Head of the Charité CyberKnife Center under the Co-Directorship of Prof. Dr. V. Budach (Radiation Oncology) and Prof. Dr. P. Vajkoczy (Neurosurgery)
- since 2018 Dr. med. Markus Kufeld joined the medical team at the Cyberknife Center in Munich-Großhadern January 2018

University Career

- 1992 - 1998 Medical School at the Georg-August-University Göttingen
- 1998 National medical exam
- 1999 Doctor's Degree of the Medical Faculty Georg-August-University of Göttingen
- 2005 - 2007 Graduate School
- Master of Science „Medical Informatics“ University of Applied Science (TFH) Berlin
- 2006 National Board Neurosurgeon

Memberships

DGNC (German Neurosurgical Society), EANS (European Association of Neurosurgical Societies), GMDS (German Society of Medical Informatics, Biometrics and Epidemiology), RSS (Radiosurgery Society)

OUR COOPERATION PARTNERS

TOGETHER, FOR THE PATIENT

The European Cyberknife Center Munich cooperate with numerous national and international centers and cooperation partners in the field of medicine. This benefits our patients. We maintain close international contacts with clinics and scientists involved in Cyberknife technology. Regular conferences with the manufacturer's (Accuray) team of developers ensure the continuous optimisation of both the system and treatment. Our center is an international reference site for Accuray, the manufacturer of Cyberknife.

Prof. Muacevic is a former board member and former president of the Radiosurgery Society (therss.org), a medical association with responsibility for improving international treatment standards. Our physicians speak regularly at national and international symposiums and scientific meetings.

The close collaboration with the University Hospital of Munich, with which we have concluded a formal clinical/scientific cooperation agreement, is of particular importance. The Cyberknife Center maintains close contacts with the departments of neurology, radiology, internal medicine, oncology, urology, thoracic surgery and ophthalmology.

The center has also entered into a scientific cooperation with the Institute for Robotics and Cognitive Systems at Lübeck University, where central components of the Cyberknife system (software control) were developed. Medical/scientific issues are dealt with in cooperation with the major German university clinics that apply Cyberknife technology (e.g. Charité, Berlin).

All therapeutic measures are scientifically monitored and data is evaluated to ensure their continued technological and medical development. The Cyberknife Center Munich is one of the most up-to-date and experienced centers for radiosurgery in the world.

„Our patients benefit from the intensive level of scientific exchange.“

Prof. Dr. med. Alexander Muacevic

CYBERKNIFE FAQs

What exactly is radiosurgery?

Radiosurgery is the extremely accurate, high-dose radiation of a precisely defined target volume and is usually performed in just one treatment session. Radiosurgical treatment destroys tumour cells.

How exactly is the tumour destroyed?

The radiation delivery device moves to between 150 – 250 different positions (from possible 3,000) around the patient. The radiation beams cross at the area to be treated (tumour) to produce the high radiation dose required to destroy the tumour. The high radiation concentration effectively destroys the DNA of the diseased cells without affecting surrounding healthy tissue.

What are the advantages of this treatment for the patient?

- non-invasive
- pain-free
- no head-frame
- no anaesthesia
- outpatient procedure
- no rehabilitation

Is treatment always non-invasive?

A local anaesthesia may be needed to position gold fiducial markers in tumours located in moving organs or that move during breathing. These gold markers serve to identify the exact location of the tumour during treatment.

Will my health insurance pay for the cost of treatment?

Most health insurances have undertaken to cover the costs of Cyberknife treatment. These include, e.g. AOK Bavaria, Barmer GEK, LKK, Deutsche BKK, KKH and most Bavarian BKKs. Private health insurers have also undertaken to reimburse costs. International patients need to inquire for a cost estimate.

Are there any side effects?

Most patients only experience minor or short term effects. Details of possible side effects will be discussed with you personally prior to beginning treatment.

How safe is Cyberknife treatment?

A precision robot places a high radiation dose into the tumour from different angles and with pinpoint accuracy. An imaging system monitors all target movements, which are then compensated by the robot. If the tumour is mobile during breathing, a 3D camera is used to dynamically track external respiration and the robot adjusts to 'breathe' in time with movement. The Cyberknife accurately targets the tumour – healthy surrounding tissue is spared from damage.

What are the advantages of the Cyberknife technique?

The M6-generation Cyberknife combines the highest level of accuracy and flexibility. The beam is shaped by means of different collimators (round, variable iris and multileaf collimators). We select the appropriate system according to the size, location and position of the tumour. This allows us to achieve even better quality with shorter treatment times – to the advantage of the patient.
